DIAMOND CUTTING TOOLS

TYPES OF DIAMOND BLADES

A diamond blade is a circular steel disc with a diamond-bearing edge. The edge or rim can have either a segmented, continuous or serrated rim configuration.

The blade core is a precision-made steel disc which may have slots called "gullets". These provide faster cooling by allowing water or air to flow between the segments. These slots also allow the blade to flex.

Blade cores are tensioned so that the blade will run straight at the proper cutting speed. Proper tension also allows the blade to remain flexible enough to bend slightly under cutting pressure and then go back to its original position.

Diamond segments or rims are made up of a mixture of diamonds and metal powders. The diamonds used in bits and blades are man-made (synthetic) and are carefully selected for their shape, quality, friability and size. These carefully selected diamonds are mixed with a powder consisting of metal such as cobalt, iron, tungsten, carbide, copper and other materials. This mixture is then molded into shape and then heated at temperatures from 1700° to 2300° under pressure to form a solid metal part called the "bond" or "matrix". The segment or rim is slightly wider than the blade core. This side clearance allows the cutting edge to penetrate the material being cut without the steel dragging against the sides of the cut.

There are several methods of attaching the segments to the steel core. * Brazing - Silver solder is placed between the segment and the core and then heated until the solder melts and bonds the two together. (This method is used for wet cutting blades only). * Laser welding - The diamond segment and steel core are welded together by a laser beam . * Mechanical bond - A notched, serrated or textured blade core may be used to "lock" the diamond rim or segments onto the edge of the blade. Mechanical bonds usually also include brazing or other metallurgical bonding processes to hold the rim or segments in place.

After the blade is assembled, it is "opened", "broken in" or "dressed" by grinding the edge concentric to the center. This exposes the diamonds that will be doing the work and establishes the cutting direction as noted by the direction arrow stamped into the blade.

HOW DO DIAMOND CUTTING TOOLS WORK?

Diamond blades don't cut, they grind! The exposed diamond crystals do the grinding work. The metal matrix or bond holds the diamonds in place. Trailing behind each exposed diamond is a "bond tail" which helps to support the diamond. As the blade rotates through the material the exposed surface diamonds grind the material being cut into a fine powder.

After several thousand passes through the material being cut the exposed diamonds begin to crack and fracture. The matrix holding the diamond also begins to wear away.

Eventually the diamond completely breaks up and its fragments are swept away with the material that it is grinding.

As the old diamonds are worn down they are replaced by new ones and the process continues until the blade is worn out.
The following factors affect the performance of a concrete cutting blade or bit and should be considered when making your selection:

### Compressive Strength

Concrete may vary greatly in compressive strength which is measured in POUNDS per SQUARE INCH (PSI). Most concrete roads are approximately 4-6,000 PSI, while typical patios and sidewalks are about 3,000 PSI.

<table>
<thead>
<tr>
<th>Concrete Hardness</th>
<th>PSI</th>
<th>Application</th>
</tr>
</thead>
<tbody>
<tr>
<td>Critically Hard</td>
<td>8,000 +</td>
<td>Nuclear power plants</td>
</tr>
<tr>
<td>Hard</td>
<td>6-8,000</td>
<td>Bridge piers</td>
</tr>
<tr>
<td>Medium</td>
<td>4-6,000</td>
<td>Highways</td>
</tr>
<tr>
<td>Soft</td>
<td>3,000 or less</td>
<td>Sidewalks &amp; patios</td>
</tr>
</tbody>
</table>

### Reinforcing Steel

Steel reinforcing tends to make a blade cut slower. Less reinforcing allows a blade to cut faster. Heavy rebar can also result from different grades of steel. Typical rebar is grade 40 but grade 60 is also common.

<table>
<thead>
<tr>
<th>Size</th>
<th>Examples</th>
</tr>
</thead>
<tbody>
<tr>
<td>Light</td>
<td>Wire mesh, single mat.</td>
</tr>
<tr>
<td>Medium</td>
<td>#4 rebar, every 12&quot; on center each way (OCEW)</td>
</tr>
<tr>
<td></td>
<td>Single mat, Wiremesh, multi-mat</td>
</tr>
<tr>
<td>Heavy</td>
<td>#5 rebar, 12&quot; OCEW, single mat.</td>
</tr>
<tr>
<td></td>
<td>#4 rebar, 12&quot; OCEW, double mat</td>
</tr>
</tbody>
</table>

### Size of Aggregate

Larger aggregates tend to make a blade cut slower while smaller aggregates tend to allow a blade cut faster. The most common aggregate sizes are:

<table>
<thead>
<tr>
<th>Size</th>
<th>Description</th>
</tr>
</thead>
<tbody>
<tr>
<td>Pea Gravel</td>
<td>Usually less than 3/8&quot; in diameter</td>
</tr>
<tr>
<td>3/4&quot;</td>
<td>Sieved size</td>
</tr>
<tr>
<td>1-1/2&quot;</td>
<td>Sieved size</td>
</tr>
</tbody>
</table>

### Type of Sand

Sand is the component of the mix which determines the abrasiveness of the concrete. Sand can either be "sharp" (abrasive) or "round" (non-abrasive). Crushed sand or bank sand are usually sharp; river sand is usually round.

### Hardness of Aggregate

There are many different types of rock used as aggregate. Generally hard aggregate breaks down the cutting diamonds faster which means the bond must be softer to expose new diamonds. Softer aggregate generally does not break down the cutting diamonds as quickly and therefore requires a harder bond to hold the diamonds in place to use their full potential. The Mohs' scale is used to measure the hardness of aggregate and has a range of 1 - 10. Most aggregates fall into the 2-9 range:

<table>
<thead>
<tr>
<th>Mohs' Range</th>
<th>Description</th>
<th>Aggregates</th>
</tr>
</thead>
<tbody>
<tr>
<td>8-9</td>
<td>Critically Hard</td>
<td>Flint, Chert, Trap Rock, Basalt River Rock, Granites, Quartz, Trap Rock</td>
</tr>
<tr>
<td>6-7</td>
<td>Hard</td>
<td>River Rock, Granites, Quartz, Trap Rock</td>
</tr>
<tr>
<td>4-5</td>
<td>Medium/Hard</td>
<td>Granites, River Rock</td>
</tr>
<tr>
<td>3-4</td>
<td>Medium</td>
<td>Limestone, Sand Stone, Dolomite, Marble</td>
</tr>
<tr>
<td>2-3</td>
<td>Soft</td>
<td>Soft Limestone</td>
</tr>
</tbody>
</table>

### Green or Cured Concrete

The drying or curing of concrete greatly affects how the concrete will interact with a diamond blade. Green concrete is freshly poured concrete that has not yet cured. It is softer and more abrasive than cured concrete. A harder bond with undercut protection should be used in this application until it is cured at which point a softer bond would be appropriate. The definition of green concrete can vary widely. Water, temperature, moisture in the aggregate, time of the year and the amount of water in the mix all influence the curing time. It is generally considered "green" for 8 to 48 hours after it has set.

### CORE BIT NOMENCLATURE

- **SEGMENT** - Metal matrix containing diamonds which are brazed or welded to the tube.
- **WATERWAY** - Allows cooling water to reach the cutting surface.
- **TUBE OR BARREL** - Nominally 14" in length with a 13" core depth.
- **HUB** - 1/2" to 1-1/2" threaded 5/8-11 to 1-5/8 and up threaded 1-1/4-7

### CORE RIG NOMENCLATURE

- **VACUUM MOTOR**
- **VACUUM BASE**
- **VACUUM GASKET** (under vacuum base)
- **LEVEL SCREWS (4)**
- **VACUUM BLEED VALVE**
- **VACUUM PRESSURE GAUGE**
- **WATER SWIVEL**
- **SCREW JACK**
- **AMPETER**
- **GAUGE**
- **VACUUM SLOT OR ANCHOR HOLE**
- **VACUUM SLOT**
- **OR**
- **ANCHOR HOLE**
- **LEVEL SCREWS (4)**
A QUESTION OF QUALITY
DO YOU WANT TO KNOW THE PRICE OR HOW MUCH IT WILL COST?

WHICH BIT DO I BUY?

4" PREMIUM
$375 (is the price)
APPROXIMATE LIFE IN FEET - 65
COST PER INCH FOOT
= \frac{$375}{65} = $5.76 \text{ Per Ft.}
HOLES TO BE DRILLED
200 @ 8" (=133.2 Ft.)
= $5.76 (Cost per Ft.) \times 133.2
= $767.23 \text{ Cost of Bits}

4" HEAVY DUTY
$300 (is the price)
APPROXIMATE LIFE IN FEET - 45
COST PER INCH FOOT
= \frac{$300}{45} = $6.66 \text{ Per Ft.}
HOLES TO BE DRILLED
200 @ 8" (=133.2 Ft.)
= $6.66 (Cost per Ft.) \times 133.2
= $887.11 \text{ Cost of Bits}

4" STANDARD DUTY
$225 (is the price)
APPROXIMATE LIFE IN FEET - 30
COST PER INCH FOOT
= \frac{$225}{30} = $7.50 \text{ Per Ft.}
HOLES TO BE DRILLED
200 @ 8" (=133.2 Ft.)
= $7.50 (Cost per Ft.) \times 133.2
= $999.00 \text{ Cost of Bits}

WHICH BLADE DO I BUY?

12 X.125 X 20MM PREMIUM
$575 (is the price)
APPROXIMATE LIFE IN INCH FEET - 10,000
COST PER INCH FOOT
= \frac{$575}{10,000} = .0575 \text{ c Per In. Ft.}
INCH FEET TO BE CUT
25,000
= .0575 (Cost per In Ft.) \times 25,000
= $1437.50 \text{ Cost of Blades}

12 X.125 X 20MM HEAVY DUTY
$425 (is the price)
APPROXIMATE LIFE IN INCH FEET - 6,500
COST PER INCH FOOT
= \frac{$425}{6,500} = .0654 \text{ c Per In. Ft.}
INCH FEET TO BE CUT
25,000
= .0654 (Cost per In Ft.) \times 25,000
= $1635.00 \text{ Cost of Blades}

12 X.125 X 20MM STANDARD DUTY
$325 (is the price)
APPROXIMATE LIFE IN INCH FEET - 4,500
COST PER INCH FOOT
= \frac{$325}{4,500} = .0722 \text{ c Per In. Ft.}
INCH FEET TO BE CUT
25,000
= .0722 (Cost per In Ft.) \times 25,000
= $1805.00 \text{ Cost of Blades}
TROUBLE SHOOTING DIAMOND BLADES

BURNING

CAUSE: Insufficient coolant (water) at the cutting surface of a wet cut core bit or blade.
REMEDY: Increase the flow of water and check for proper direction of the water to the cutting surface.

CAUSE: Insufficient cooling (air)
REMEDY: Allow the blade to cool every few feet of cut by running it

SEGMENT LOSS

CAUSE: On stone or masonry blades the material may not have been held firmly which allowed the blade to twist or jam.
REMEDY: Material must be held firmly.
CAUSE: Overheating due to an inadequate supply of water. Look for burning or discoloration near missing segments.
REMEDY: Provide adequate supply of water.
CAUSE: Undercutting which wears away blade core and weakens the weld between segment and core.
REMEDY: Increase water supply and if material being cut is very abrasive change to a wear-resistant core.
CAUSE: Blade is too hard for material being cut causing excessive dullness and the segment separates because of impact, fatigue or frictional heat.
REMEDY: Use the proper blade specification for material being cut.

UNDERCUTTING

CAUSE: A condition in which the steel core wears at a faster rate than the diamond segments. It is caused by highly abrasive material grinding against the core.
REMEDY: The blade core should be equipped with undercut protectors or polyaric segments.

WORN OUT-OF-ROUND

CAUSE: Blade collar is not properly tightened allowing it to turn or rotate on shaft.
REMEDY: Tighten collars.
CAUSE: Worn or dirty collars which do not allow proper blade clamping.
REMEDY: Clean and replace if necessary.
CAUSE: Blade not properly mounted.
REMEDY: Rebore arbor hole if within tolerances.

ARBOR OUT OF ROUND

CAUSE: Worn shaft bearings on saw which allows blade to run eccentric.
REMEDY: Install new bearings.
CAUSE: Engine not properly tuned which causes "hunting".
REMEDY: Tune the engine.
CAUSE: Blade arbor hole is damaged.
REMEDY: If blade is in good condition the core may be re-bored.
CAUSE: Blade mounting arbor is worn or is the wrong size.
REMEDY: Replace worn arbor busing or arbor shaft.
CAUSE: Bond is too hard for material causing machine to "pound" at regular intervals, thereby wearing one half of the blade more than the other.

LOSS OF TENSION

CAUSE: Blade is used on an misaligned saw.
REMEDY: Check for proper saw alignment.
CAUSE: Blade is excessively hard for the material being cut.
REMEDY: Correct bond spec.
CAUSE: Material slippage causing blade to twist.
REMEDY: Maintain a firm grip on material while cutting.
CAUSE: Undersize or mis-matched blade collars.
REMEDY: Minimum 3-7/8" - 4-1/2" on concrete saws, 6" Minimum on blades over 30".
CAUSE: Blade used at improper RPM.
REMEDY: Check shaft RPM.
CAUSE: Improper mounting on arbor shaft allows collars to bend blade when tightened.
REMEDY: Make sure blade is securely on arbor shoulder until outside flange and nut are firmly tightened.

EXCESSIVE WEAR UNDERCUTTING

CAUSE: Using the wrong blade spec. on highly abrasive materials.
REMEDY: Change to a more abrasive resistant bond.
CAUSE: Lack of sufficient coolant to the blade often detected by excessive wear in the center of the segment.
REMEDY: Make sure water supply system is functioning properly.
CAUSE: Wearing out-of-round accelerates wear. Usually caused by bad bearings, loose or worn "V" belts.
REMEDY: Replace bad bearings or worn "V" belts.
TROUBLE SHOOTING DIAMOND BLADES

CORE CRACKS

CAUSE: Blade is too hard for material being cut.
REMEDY: Change to softer bond.
CAUSE: Excessive cutting pressure, or jamming or twisting of the blade
REMEDY: The saw operator should use a steady even pressure without twisting the blade in the cut.
CAUSE: Overheating through inadequate water supply or not allowing a dry blade to intermittently cool down.
REMEDY: Use adequate water on wet cutting blades and allow adequate air flow on dry blades.

SEGMENT CRACKS

CAUSE: Blade is too hard for the material being cut.
REMEDY: Use correct blade with a softer bond.

MISMOUNTING

CAUSE: Blade collars are not properly tightened or are worn out.
REMEDY: Check tightness and replace collars if necessary.

UNEVEN SIDE WEAR

CAUSE: Insufficient water, generally on one side of blade.
REMEDY: Make sure water is being distributed evenly on both sides of blade.
CAUSE: Equipment problem which causes blade to wear out of round.
REMEDY: Replace bearings, worn arbor shaft or misaligned spindle.
CAUSE: Saw Head is misaligned.
REMEDY: Check saw head alignment for squareness both vertically and horizontally.

TROUBLE SHOOTING CORE BITS

GLAZING
(Bit stops drilling or is very slow)

CAUSE: Too much feed pressure.
REMEDY: Open bit with abrasive material (Sand pot, concrete block, chop saw blade).
Reduce feed pressure. Using an ammeter will help to control speed and pressure.
CAUSE: Aggregate is too hard.
REMEDY: Change to a softer bond.

LOST SEGMENTS (Particularly on bits up to 1-3/4")

CAUSE: Steel reinforcing rod
REMEDY: Ease up on feed pressure (watch ammeter).
Use a higher quality bit and increase the water flow.
CAUSE: Not enough water to properly cool bit.
REMEDY: Increase water flow.
CAUSE: Drill rig is not properly anchored.
REMEDY: There are three ways of anchoring a core rig.
STANDING ON IT IS NOT ONE OF THEM!
This quick and dirty method damages the bit and the rig and dramatically slows the drilling process.

BENT SEGMENTS

CAUSE: Too much feed pressure and not enough water.
REMEDY: Repair the bit if possible.
Ease up on feed pressure and increase water flow.
CAUSE: Aggregate is too hard.
REMEDY: Change to a softer bond.

CORE HANGS UP

CAUSE: Not enough water to remove slurry.
REMEDY: Remove bit and drive core out with a spike through the hub. Increase water flow.
CAUSE: Core barrel is dented because of hammering on it to remove previous hung up cores.
REMEDY: Repair the barrel. Increase water flow.
